Hiring Committee
Terminal Investment Limited / MSC
Geneva, Switzerland

May 29, 2026

Dear Hiring Committee,

I am applying for the Director of Technology role because the mandate maps closely to the work I have done as a technology executive in Geneva: define technology strategy, build target architecture, govern cybersecurity and operational reliability, align stakeholders, and turn complex technology portfolios into execution.

At FlowBank, I led a technology department of roughly 40 people and built the target architecture, roadmap, and budget for the Executive Committee. The work covered a move from on-premise infrastructure to AWS, DevOps culture, CRM, Core Banking, and data-driven services. That is the closest pattern to TIL's need for a technology blueprint across a portfolio: make the operating model clear, decide where standardization creates value, and keep delivery tied to business priorities.

At Ripple / Metaco, I led up to 50 engineers on a blockchain custody platform where reliability, security, architecture coherence, technical debt, release quality, and client needs all mattered at the same time. Earlier, at UBP, I led IT and banking security audits, including identity access work that uncovered an application-role bug affecting 0.5% of bank users. That combination is relevant to your cybersecurity, disaster recovery, risk reporting, and portfolio governance requirements.

I do not want to overstate terminal-domain tenure. My direct background is in regulated technology, banking, blockchain custody, commodity/trade systems, cloud, DevOps, and enterprise delivery, not 10 years running container terminals. I would treat terminal operating systems, IT/OT interfaces, site constraints, partner landscape, and MSC integration points as the first ramp-up priority. The transferable pattern is familiar: heterogeneous systems, high reliability expectations, strong security constraints, board-level decisions, and the need to standardize only where standardization genuinely improves operations.

The role is interesting because it is not a generic IT leadership position. It sits at the intersection of technology strategy, operational infrastructure, cybersecurity, partners, investment decisions, and global supply-chain impact. That is where I do my best work: translating technical complexity into practical decisions that executives, engineers, operators, and partners can act on.

I would welcome a conversation about where TIL wants to standardize technology across terminals, where local autonomy should remain, and how the Director of Technology can make that transition measurable without slowing terminal operations.

Regards,

Thibault Fouache
