Atlantic Gate
Geneva, Switzerland

May 30, 2026

Dear Atlantic Gate team,

I am applying for the Corporate IT Director role because the mandate matches the type of technology leadership I have delivered in Geneva: define an IT roadmap, align it with business growth, govern systems and vendors, improve security and reliability, and build teams that can execute across regions and functions.

At FlowBank, I led a technology department of approximately 40 people for a FINMA-regulated neobank. The scope covered software engineering, data, infrastructure, service delivery and outsourced providers. I built the technology vision, roadmap, annual budget and execution indicators for the Executive Committee; initiated the transition from on-premise infrastructure to AWS; and launched core initiatives including CRM, Core Banking and a real-time data platform. That experience maps directly to your need for global IT strategy, core systems integration, budget ownership, vendors, BI-style reporting and executive alignment.

At Ripple / Metaco, I led up to 50 professionals across Geneva and San Francisco on a regulated blockchain custody platform for institutional financial clients. I managed managers and tech leads, structured squads, created a dedicated support and L3 team, and strengthened quality, monitoring, release management, technical debt control and incident handling. This is the operating model I would bring to an international logistics IT environment where scalability, reliability and delivery discipline matter.

I also bring relevant supply-chain-adjacent systems experience. At BCP, I built commodity trade finance tooling and coordinated offshore developers. At Glencore, I contributed to a commodity trade system rewrite by capturing trader needs and delivering technical architecture and implementation. I have not led a pure logistics IT function for ten years, so I would treat Atlantic Gate's TMS, EDI/API flows, forwarding operations and regional constraints as a deliberate ramp-up area. The transferable pattern is familiar: understand business workflows, connect systems, standardize governance, and make technology useful to operations.

Cybersecurity and governance are also part of my base. At UBP, I led IT and banking security audits covering risk, procedures, GDPR-related controls, IAM and remediation planning, and found an application-role bug affecting 0.5% of bank users. I know that governance needs evidence, ownership and follow-through, not only policies.

Atlantic Gate's role is attractive because it combines international scope, logistics systems, ERP/TMS/CRM/BI, cybersecurity, automation, vendors, budget and direct senior leadership partnership. I would welcome a discussion about the current IT organization, the core systems landscape, the size of the team and budget, and the transformation priorities for the first 12 months.

Kind regards,

Thibault Fouache
